### KLIMA RENEW SYSTEM

**IDEAL FOR  
RENOVATION  
WORKS AND  
WHEN REDUCED  
INSTALLATION  
THICKNESS IS  
REQUIRED**

The R979S Spider panel is a 3D plastic polymer mesh, printed with high-resistance polypropylene. Its reduced overall thickness and shape make this panel particularly suitable for renovation and energy requalification. The patented geometry of the tridimensional mesh allows to firmly fit the pipe during installation and fully sink it in the screed. This ensures an ideal and even heat distribution combined to reduced thermal inertia. Available in two versions: Standard and Slim.

## KLIMA NEW BUILDING SYSTEM

**IDEAL FOR NEW  
CONSTRUCTIONS  
OR INSTALLATIONS  
WITH NO SPECIFIC  
THICKNESS  
REQUIREMENTS**

R982Q preformed panels are used in radiant floor systems to improve pipe insulation. Their use is essential to create modern and functional radiant systems as they heat rooms in a very short time with limited powers, therefore also limiting the mass of the radiant structures and reducing heat dispersions downwards. The use of insulation panels reduces the quantity of pipes required and as a consequence the number of radiant circuits, the water flow rates, the diameters of supply pipes, the hydraulic heads of the circulators and the powers involved, leading to immediate energy saving in the name of environment protection.

Hot domestic water heater with integrated air/water heat pump. The water heater takes its energy from the ambient air - depending on the type of installation it can either take the air from the room where it is located or the outside air. The heat pump transforms the heat from the air to heat for domestic water. It is often installed in rooms with limited surface area, such as the laundry room or garage.

Hydronic unit for heat pumps, designed for optimal control of heating/cooling services and hot domestic water (HDW).

- Metal frame for wall fitting.
- Preassembled solution to cut down the time required for installation and prevent execution errors.
- Connection to HDW storage.
- Control of thermal storage tank to decouple the heating/ cooling system from the heat pump status: HDW production during cooling or execution of defrosting cycle during heating.
- Diverting valve to change over the control modes of both the HDW storage and the heating/cooling services.
- Magnetic dirt separator with high filtering capacity.
- The unit can be completed with a relaunching pump, an insulation (for codes without insulation) and a diverting valve actuator.

# COMPONENTS FOR BOILER ROOM

Modern buildings should offer work continuity, easy maintenance and low running costs; for this reason, boiler rooms characterized by high safety, reliable protection and total compliance with laws are required. In order to satisfy these requests, Giacomini offers a complete range of boiler room components; with it, a single supplier can provide all you need for thermo-vector fluid and sanitary water distribution from central room to room terminals.

The application of the boiler room components shown in the figure is merely an example. The sizing of the components, and their positioning in the layout diagram, depends on the system configuration chosen during the design phase.

Pressure independent control valve (PICV). Combines an automatic control of the flow rate with an optional control of the valve through an actuator. The valve is able to regulate the flow rate and keep it constant as the differential pressure conditions vary within the hydraulic circuit in which it is installed.

The valve can be used with two operating modes:

- independent control of the pressure (with K281 actuator installed) in accordance with the thermal load requirements of the circuit section to be controlled;
- limitation of the flow rate and/or shut-off of the fluid (without actuator or with R473 thermo-electric actuator installed). Flow rate adjustment is guaranteed within the declared differential pressure range, with a maintained error of  $\pm 10\%$  on the controlled flow rate value.

The valve is equipped with pressure ports for measuring the differential pressure in combination with a differential pressure gauge and its own probes. R73PY010 setting key for flow rate presetting included.

Temperature range:  $5 \div 120$  °C.  
 Max. working pressure: 25 bar (2,5 MPa).  
 Working differential pressure range:  
 25÷400 kPa (max. 4 bar) with R473 thermo-electric actuator;  
 25÷800 kPa (max. 8 bar) with K281 actuator or without actuator.  
 Actuator connection: M30 x 1,5 mm.

Pressure independent control valve (PICV) with flanged connections.

It is suitable to be integrated in automated building management system. Compensating the pressure variations and keeping constant the system performance in case of load changes, assures an improvement of environmental comfort as well as a pumping cost reduction.

The valve could be equipped with an actuator for proportional or 3-points control; manually operated version can be supplied as well.

Working conditions with water

- Working temperature range: -10÷120 °C

- Max. static pressure: 16 bar

- Max. differential pressure: 4 bar

Differential pressure control valve DPCV with flanged connections.

The valves balance and control the differential pressure automatically and proportionally. The valve balances the flow in the main network or in the single risers and branches of a heating/cooling system, controls and keeps the differential pressure over the load at a stable value, reducing the risk of noisiness and wear of the thermostatic control valves.

The setting range of the differential pressure delivered is comprised between  $0,2 \div 1,0$  and  $0,8 \div 1,6$  bar for DN65-100 and between  $0,2$  and  $0,8$  bar for DN125-150.

Working conditions with water

- Working temperature range:  $-10 \div 120$  °C
- Max. working pressure: 16 bar
- Controllable differential pressure range for DN65-DN100:  $20 \div 100$  kPa or  $80 \div 160$  kPa.
- Controllable differential pressure range for DN125-DN150:  $20 \div 100$  kPa.

## DATA CENTRALIZATION WITH M-BUS

The European Parliament and Council of the European Union have adopted Directive 2014/32/EU concerning measurement instruments (MID – Measurement Instrument Directive): it sets the requirements for a set of devices and measurement systems in order to be marketed and operated in UE countries.

All measurement devices used in modules and HIUs comply with MID European Directive.

## COMPLIANCE WITH MID DIRECTIVE (2014/32/EU)

The use of measurement instruments suitable for the recording of consumption data is particularly important for the aspects that involves, as the consumer and environment protection, the fair expense sharing out, the imposition of taxes or the correctness of the commercial transactions. For this reason, the Countries of the European Union have acknowledged MID Directive (2014/32/EU) that defines the requirements to which the measurement instruments shall comply with to be marketed or started.

The range of Giacomini's modules and user HIUs includes exclusively measurement devices complying with the Directive, as attested on them by the presence of the MID metrological marking close by the CE marking.

## METROLOGICAL MARKING

Compliance of measurement devices with all provisions of D.Lgs. 2nd February 2007 n.22 is certified by the presence, on them, of CE marking and of metrology marking composed of letter "M" and of the last two digits of the year of production.

## OMS: Open Metering System

The Open Metering System (OMS) is the only specification in Europe intended to integrate the instruments for measuring various elements, to guarantee their interoperability and future operation. The water and heat meters and the heat cost allocators using an open communication standard are interchangeable regardless of the producer and guarantee maximum safety and data protection levels.
